

# MultiPro

- (1) Smart card connector
- (2) LED for data transfer
- (3) LED
- (4) LED
- (5) LED
- (6) RS232 cable for connection with your computer

## Connection of the MultiPro

Shut down the computer. Please make sure the computer is grounded. You should connect the computer to grounded mains.

- Connect the RS232 connector of the MultiPro (9) to a serial comport of your computer
- Connect the PS2 male connector (8) of the MultiPro to a PS2 port of your computer
- If you have to remove or want to add a device that has to make use of the PS2 port of your computer, you can connect that device to the PS2 Female connector (7) of the MultiPro

The MultiPro is now ready for use and the computer can be turned on again.

### **Use of the MultiPro:**

- If you turn your computer on, the green led (4+5) will light up. If you don't see a green light, the MultiPro is probably not connected correctly; see previous chapter

### **Problems:**

Is the smart card put correctly into the smart cardholder? → The smart card has to be put as far in the smart card connector (1) as possible. The contact surface has to face downwards when inserted in the reader.

Have you selected the right serial comport? → Try to change in the software/program the serial comport or put the RS232 cable into another serial comports.

The software gives an error message → Be certain you are using the right software and that you use the software correctly. If a manual is included, read this document carefully before running the software.
